Improving Adult Immunizations Through Implementing the Standards for Adult Immunization Practice

Vaccines for Adults Program (VFA) Webinar
June 28, 2018
Goals of Presentation

- Provide information on
  - Burden of vaccine-preventable disease and illness
  - Recommended adult vaccines
  - Current adult vaccination rates

- Review “Practice Standards for Adult Immunization”

- Provide resources for implementing the “Practice Standards”

- Provide a VFA Program update
Burden of Disease Among U.S. Adults for Diseases with Vaccines Available

- Pneumococcal disease
  - 33,900 cases, 3,700 deaths in 2013
  - 89% cases, almost all deaths among adults
- Zoster
  - ~1 million cases annually
  - Incidence increases with age, <1 case/1000 children to >15 cases/1000 adults ≥80y
  - 10–18% adults ≥50y with zoster will go on to develop PHN
- Hepatitis B
  - Incidence among children and adolescents <19y – 0.2/100,000
  - Incidence among adults 0.5/100,000 for ≥60y, 2.6/100,000 for 30–39y
- Pertussis
  - Underdiagnosed and underreported, 10,000–50,000 cases per year
  - Adults ≥65y – estimated 1–5/100,000
Recommended Adult Vaccines

- Vaccines are an important part of optimizing health of the vaccinated person, and preventing infections in others.

- Example: Vaccination against influenza and pertussis reduces the risk in the person vaccinated and also prevent someone from spreading these diseases.
Recommended Adult Vaccines

Recommended for adults who meet the age requirement, lack documentation of vaccination, or lack evidence of past infection

Recommended for adults with other indications

No recommendation

www.cdc.gov/vaccines/schedules/hcp/adult.html
# Recommended Adult Vaccines

![Image of a chart showing recommended vaccines for adults]

**Recommended for adults who meet the age requirement, lack documentation of vaccination, or lack evidence of past infection**

**Recommended for adults with other indications**

**Contraindicated**

**No recommendation**

---

1. **Influenza**: 1 dose annually
2. **Tdap** or Td: 1 dose Tdap each pregnancy, then Td booster every 10 yrs
3. **MMR**: contraindicated (1 or 2 doses depending on indication)
4. **VAR**: contraindicated (2 doses)
5. **RZV** (preferred) or ZVL: 2 doses RZV at age ≥50 yrs (preferred) or 1 dose ZVL at age ≥60 yrs
6. **HPV—Female**: 3 doses through age 26 yrs, 2 or 3 doses through age 26 yrs
7. **HPV—Male**: 3 doses through age 26 yrs, 2 or 3 doses through age 21 yrs
8. **PCV13**: 1 dose
9. **PPSV23**: 1, 2, or 3 doses depending on indication
10. **HepA**: 2 or 3 doses depending on vaccine
11. **HepB**: 3 doses
12. **MenACWY**: 1 or 2 doses depending on indication, then booster every 5 yrs if risk remains
13. **MenB**: 2 or 3 doses depending on vaccine
14. **Hib**: 3 doses MSC recipients only, 1 dose

---

Impact of Vaccination

- Vaccine effectiveness varies by vaccine type, the disease outcome, and the age or health of the person vaccinated
  - Zoster (Shingles) vaccine effectiveness: 97% against shingles and 91% against post-herpetic neuralgia (PHN)\(^1\)
  - PCV13 (pneumococcal conjugate vaccine): 45% efficacy against vaccine-type pneumococcal pneumonia, and 75% efficacy against vaccine-type invasive pneumococcal disease among adults aged ≥65 years\(^2\)
  - Influenza vaccine: varies annually based on antigenic match and also age and health of person being vaccinated – about 60–70% in younger adults and about 30% in adults 65 years and older against medically attended influenza when good match\(^3\)
  - Hepatitis B vaccine: 90% effectiveness after completing a 3-dose series, though lower in persons with diabetes, e.g. 90% with diabetes and age <40 years, 80% with diabetes and 41–59 years, 65% if 60–69 years and <40% if 70 years or older\(^4\)

  - 2015: 35.9%
  - 2016: 35.9%

- **pneumococcal, 19-64 high risk**
  - 2014: 34.1%
  - 2015: 34.1%
  - 2016: 34.1%

- **pneumococcal, >65**
  - 2014: 72.4%
  - 2015: 72.4%
  - 2016: 72.4%

- **Tdap, >65 yrs**
  - 2014: 29.4%
  - 2015: 29.4%
  - 2016: 29.4%

- **Tdap, 18-49 yrs**
  - 2014: 63.8%
  - 2015: 63.8%
  - 2016: 63.8%

- **tetanus past 10 yrs, 19-49**
  - 2014: 63.8%
  - 2015: 63.8%
  - 2016: 63.8%

- **tetanus past 10 yrs, >65**
  - 2014: 54.5%
  - 2015: 54.5%
  - 2016: 54.5%
Disparities In Adult Immunization Rates

- Lower vaccine coverage among
  - Hispanics and African Americans compared to non-Hispanic Caucasians
  - Uninsured
  - Lower incomes

- Improve frequency of provider vaccine assessment and recommendations may help reduce disparities

- For newly insured adults
  - Affordable Care Act (ACA) requires non-grandfathered private plans to include coverage for ACIP-recommended vaccines
  - Especially important to conduct assessment among newly insured

Key Adult Immunization Facts

- **Challenges**
  - Vaccine coverage among adults is unacceptably low
  - Limited patient awareness about need for vaccines among adults
  - Adult vaccinations less integrated into clinical practice

- **Opportunities**
  - Most patients willing to get vaccinated when recommended by medical providers
  - Primary care providers believe that immunizations are an important part of the services they provide to patients
  - Systematic offering and recommendations from clinicians result in higher uptake

- Guide to community preventive services: [www.thecommunityguide.org/vaccines/index.html](http://www.thecommunityguide.org/vaccines/index.html)
- Adult non-influenza vaccine coverage: [www.cdc.gov/mmwr/preview/mmwrhtml/mm6305a4.htm](http://www.cdc.gov/mmwr/preview/mmwrhtml/mm6305a4.htm)
Adult Immunization Practice Standards

- Stresses that all providers, including those that don’t provide vaccine services, have a role in ensuring patients are up-to-date on vaccines

- Acknowledges that:
  - Adult patients may see many different healthcare providers, some of whom do not stock some or all vaccines
  - Adults may get vaccinated in a medical home, at work, or retail setting

- Aim is to avoid missed opportunities and keep adult patients protected from vaccine-preventable diseases
Adult Immunization Practice Standards

- Calls to action for healthcare professionals
  - **Assess** immunization status of all patients in every clinical encounter.
  - **Strongly Recommend** vaccines that patients need.
  - **Administer** needed vaccines or **Refer** to a provider who can immunize.
  - **Document** vaccines received by patients, including entering immunizations into immunization registries.

http://www.publichealthreports.org

Even if you don’t vaccinate, you still need to recommend vaccines to your patients
Formally supported by healthcare organizations:
- American Academy of Pediatrics (AAP)
- American Academy of Physician Assistants (AAPA)
- American Academy of Family Physicians (AAFP)
- American College of Obstetricians and Gynecologists (ACOG)
- American College of Physicians (ACP)
- American Pharmacists Association (APhA)
- Association of Immunization Managers (AIM)
- Association of State & Territorial Health Officials (ASTHO)
- Centers for Disease Control and Prevention (CDC)
- Immunization Action Coalition (IAC)
- Infectious Diseases Society of America (IDSA)
- National Association of County & City Health Officials (NACCHO)
- National Foundation for Infectious Diseases (NFID)
Assessment

- **Implement protocols and policies.** Ensure that patients’ vaccine needs are routinely reviewed and patients get reminders about vaccines they need.
- Ask patients about their vaccinations during clinic visits
  - E.g. Include a form at check-in and communicate with patients before seeing the provider about which vaccines might be needed
- **Make sure that the systems in your clinic are setup to optimally support the standards implementation**
  - E.g. Your clinic’s EHR includes the immunization module, and immunization prompts/health maintenance forms/clinical decision guidelines are activated and updated periodically to reflect the current adult IZ schedule

Adult patient vaccine needs-assessment form from National Foundation for Infectious Diseases at NFID.org (downloaded June 25, 2018)
Examples of Assessment Tools

We believe that getting vaccinated is a critical step in protecting your health. Vaccines can help prevent common diseases that can be serious and costly for you or your loved ones. Each year, thousands of adults in America suffer serious health problems (and some even die) from diseases they could be vaccinated against like whooping cough, hepatitis A and B, flu and pneumococcal diseases, and shingles. Older adults and those with chronic health conditions are at increased risk for complication from certain diseases. Together, let’s take an active role in helping you and your loved ones stay healthy. To learn more about vaccines for adults, visit www.cdc.gov/vaccines/adults or take a quick vaccine quiz at www.cdc.gov/vaccines/adultquiz.

Please take a moment to fill out the questionnaire below to help us determine which vaccines may be recommended for you based on your specific health status, age, and lifestyle. Keep in mind that this list may not include every vaccine you need.

<table>

                               - Pneumococcal polysaccharide vaccine |
| I was born in the US in 1957 or after and don’t have immunity against measles, mumps, and rubella | - Measles, mumps, rubella (MMR) vaccine* (one dose)  
                               - Varicella (“chickenpox”) vaccine*  
                               - Measles, mumps, rubella (MMR) vaccine* (one dose)  
                               - Hepatitis B vaccine series  
                               - Pneumococcal polysaccharide vaccine |
| I was born in the US in 1980 or after and don’t have immunity against chickenpox | - Measles, mumps, rubella (MMR) vaccine* (one dose)  
                               - Varicella (“chickenpox”) vaccine*  
                               - Measles, mumps, rubella (MMR) vaccine* (one dose)  
                               - Hepatitis B vaccine series  
                               - Pneumococcal polysaccharide vaccine |
| I am a healthcare worker | - Varicella (“chickenpox”) vaccine*  
                               - Varicella (“chickenpox”) vaccine*  
                               - Measles, mumps, rubella (MMR) vaccine* (one dose)  
                               - Hepatitis B vaccine series  
                               - Pneumococcal polysaccharide vaccine |
| I have heart disease, asthma or chronic lung disease | - Varicella (“chickenpox”) vaccine*  
                               - Measles, mumps, rubella (MMR) vaccine* (one dose)  
                               - Hepatitis B vaccine series  
                               - Pneumococcal polysaccharide vaccine |

Immunization Practice Standards Implementation

- **Strongly recommend vaccines**
  - If you provide vaccines, be confident in your recommendation
  - Encourage your staff to use the same vaccine messages when caring for patients

Use the SHARE framework when talking to your patients about vaccines they are due for. Use the SHARE framework when providing important information to help patients make informed decisions about vaccinations:

- **S**hare tailored reasons why vaccination is right for the patient.
- **H**ighlight positive experiences with vaccination.
- **A**ddress patient questions and concerns.
- **R**emind patients that vaccines protect them and their loved ones against a number of common and serious diseases.
- **E**xplain the potential costs of getting sick.

[www.cdc.gov/vaccines/AdultStandards](http://www.cdc.gov/vaccines/AdultStandards)
When It Comes to Vaccines: Doctors and Patients Aren’t Hearing One Another

Most physicians say “I talk to all of my patients about vaccines”

87%

But few patients agree

18%  31%  21%

“I occasionally discuss vaccines with my HCP”  I don’t recall ever discussing vaccines

Physicians  Patients

Results are based on surveys by the National Foundation for Infectious Diseases.

November 2010
Administer needed vaccines or refer

- Develop standing orders or protocols for vaccine administration
- Ensure practice is up-to-date with vaccine storage and handling
- Develop relationships with pharmacies, health departments, and other vaccination providers to refer your patients for vaccines you don’t stock

www.cdc.gov/vaccines/AdultStandards
Document vaccines received by patients

- Document receipt of vaccine in electronic medical records
- Provide patients with vaccine documentation for their personal medical records, e.g. shot card
- Follow-up with patient or referring provider to document the vaccine given
- Enter immunization doses to state immunization registries

www.cdc.gov/vaccines/AdultStandards
Improving Use of Immunization Information Systems – CA Immunization Registry CAIR

- Increase use important for many reasons, including
  - Ensuring patients get the right vaccines at the right time
  - Tracking vaccination rates
  - Potential for use in quality measures and coverage tracking
    - In pediatrics, use of IIS known to improve vaccination
    - Improves readiness to respond to emergencies like 2009 H1N1

- Challenge: limited use by adult providers (e.g. 8% internists)\(^1\)

- CAIR online resources [http://cairweb.org/](http://cairweb.org/)

*Compared to usual care or control group, adjusted for all remaining interventions

Components of Successful Vaccination Programs

- Strategies shown to improve vaccine uptake in healthcare settings:
  - Use of standing orders
  - Use of reminder-recall systems
  - Efforts to remove administrative barriers
  - Provider and practice assessment of vaccination and feedback
  - Use of immunization registries
  - Immunization champions
  - Patient education (e.g. email reminders from providers plus provider recommendations)

Impact of Vaccine Preventable Diseases in People

**Shingles:** "I would rather have ten babies than the pain I've endured for the past ten years," says 87-year-old Etta Watson Zukerman of Bethesda, Md., who has lost partial use of her right arm and hand due to nerve damage from postherpetic neuralgia (PHN).

![Image of shingles patient](image)

Courtesy MN Oxman San Diego VAMC

**Pertussis:** Callie stopped breathing again. Family members watched helplessly from behind a glass wall as doctors tried for 45 minutes to revive her. Tragically, Callie could not be saved. She was only 5 weeks old. "We never dreamed we'd lose her," Katie said. "Callie was a more loved, more wanted baby than you'd ever find."

Testimonials from Immunization Action Coalition and CDC websites
Conclusions

- Substantial burden of disease in adults for which vaccines available
- Vaccination rates low among adults in U.S.
- Adult Immunization Practice Standards updated and supported by wide range of provider organizations
- Implementation of standards is key to increasing awareness of adult immunization, improving vaccine coverage, and reducing racial and ethnic disparities in vaccine coverage
- Many tools and resources available to:
  - Help providers implement practice standards
  - Educate patients on the importance of vaccination
VFA Program Updates

1. Orders
Only two open ordering periods left for the rest of 2018:
- Third quarter open ordering period July 9-22
- Fourth quarter open ordering period – second half of September (exact dates TBD)

2. Evaluation Reports
VFA Program Updates

1. New vaccines

- Shingrix will be available for this ordering period.
  - Orders for Zostavax may be limited or reduced based on quarterly administration data, in anticipation of the new shingles vaccine.
  - A communication with information regarding Shingrix and practical advice on how you can best prepare your practice prior to placing your first Shingrix order was sent to all VFA participants on June 25, 2018.
  - A Clinical Letter and additional ordering information will be send prior to July 9.

- Heplisav is anticipated to become available for VFA orders in quarter four
Thank you!

- **National Adult and Influenza Immunization Summit and Immunization Action Coalition (IAC)**
  
  [www.izsummitpartners.org](http://www.izsummitpartners.org) has information for providers on each vaccine and vaccine administration, storage and handling at [www.immunize.org](http://www.immunize.org).

  [https://www.izsummitpartners.org/wp-content/uploads/2014/05/AdultVaccineMessaging2.pdf](https://www.izsummitpartners.org/wp-content/uploads/2014/05/AdultVaccineMessaging2.pdf) has information on effective way to provide messaging to adults regarding immunizations

- **National Foundation for Infectious Diseases**
  
  [www.adultvaccination.org](http://www.adultvaccination.org) has tools for providers and information to help with conversations with your patients about vaccines, including the top 10 reasons to get vaccinated at [http://www.adultvaccination.org/10-reasons-to-be-vaccinated](http://www.adultvaccination.org/10-reasons-to-be-vaccinated).
Resources From Professional Provider Organizations on Adult Immunizations

- American College of Obstetricians and Gynecologists - [www.immunizationforwomen.org](http://www.immunizationforwomen.org) information about vaccines for pregnant and non-pregnant women, vaccine coding and other business practices.
- American College of Physicians - [http://immunization.acponline.org/](http://immunization.acponline.org/) has information about adult vaccinations, quality improvement, resources for practical application, and information on special populations.
- American Pharmacists Association - [http://www.pharmacist.com/immunization-resources](http://www.pharmacist.com/immunization-resources). Multiple resources, training and tools for pharmacists on immunizations.
- Infectious Diseases Society of America - [http://www.idsociety.org/Immunization/](http://www.idsociety.org/Immunization/). Provides multiple resources and also recommendations specifically for immune compromised persons.
Series for Healthcare Providers on Implementing Standards

Vaccine Needs Assessment
A Series on Standards for Adult Immunization Practice

Assessment is the critical first step in ensuring that your adult patients get the vaccines they need for protection against serious vaccine-preventable diseases.

As a standard of care—whether you provide vaccines or not—you should assess your patients’ immunization status at every clinical encounter and strongly recommend vaccines that they need.

U.S. vaccination rates for adults are extremely low.

For example:

- Only 61% of adults 19 years or older have received Tdap vaccination.
- Only 20% of adults 60 years or older have received 2 or more influenza vaccinations.
- Only 50% of adults 65 years or older have received pneumococcal vaccination.
- Only 42% of adults 18 years and older had received tetanus vaccination during the 2012-2013 flu season.

There are simple ways to implement routine vaccine assessment into your office/patient flow.

- Give patients a vaccine assessment form at check-ins.
- Include standing orders or protocols for nursing staff to assess and administer recommended vaccines.
- Integrate vaccine prompts into electronic medical records.
- See back for more tips and resources.

Routine assessing patient vaccination status will make a difference.

Adults think immunization is important, but most are not aware that they need vaccines throughout their lives. Research indicates that your recommendation is the strongest predictor of whether patients get vaccinated. Implement policies to ensure your patients’ vaccination needs are routinely addressed.

For information on insurance coverage of vaccines for adults, visit www.cdc.gov/vaccines/hcp/adults.

3 Important Reasons for Adults to Get Vaccinated

You may not realize that as an adult you still need vaccines, or why they are so important to your health. There are many reasons to get vaccinated, here are just three.

1. You may be at risk for serious diseases.
   - Each year thousands of adults in the United States suffer serious health problems from disease that could be prevented by vaccines. Some people are hospitalized, and some die. Even if you were fully vaccinated as a child, the protection from some vaccines you received can wear off over time, and you may also be at risk for other diseases due to your job, hobbies, travel, and health conditions.

2. You can protect your health and the health of those around you by getting recommended vaccines.
   - Vaccines reduce your chance of getting sick. Vaccines work with your body’s natural defenses to reduce the chances of getting certain diseases and suffering from their complications.
   - Vaccines reduce your chance of spreading disease. There are many things you want to pass on to your loved ones; illness is not one of them. Infants, older adults, and people with weakened immune systems (like those undergoing cancer treatment) are especially vulnerable to infectious diseases.

3. You can’t afford to risk getting sick.
   - Even healthy people can get sick enough to miss work or school, and most importantly time away from their loved ones. Being vaccinated is your best protection against many serious diseases. You take many steps to stay healthy – getting vaccinated is an important one.

Getting vaccinated as an adult is easier than you think.
- Adults can get vaccines at doctors’ offices, pharmacies, workplaces, community health centers, and health departments. To find a vaccine provider near you, go to VaccineFinder.org.
- Most health insurance plans cover the cost of recommended vaccines. Check with your insurance provider for details and to find an in-network provider.
- If you do not have health insurance, visit www.healthcare.gov to learn more about health coverage options.

What vaccines do you need?
- All adults should get:
  - Annual flu vaccine to protect against seasonal flu
  - Td/Tdap to protect against tetanus, diphtheria, and pertussis.

Some additional vaccines you may need (depending on your age, health conditions, and other factors) include:
- Hepatitis A
- Hepatitis B
- Human Papillomavirus (HPV)
- Meningococcal
- Pneumococcal
- Shingles

Traveling overseas? There may be additional vaccines you need depending on the location.
Find out at www.cdc.gov/travel

Vaccines are safe.
- Vaccines are tested and monitored. Vaccines are tested before being licensed by the Food and Drug Administration (FDA). Both the CDC and FDA continue to monitor vaccines after they are licensed.

Vaccine side effects are usually mild and temporary. The most common side effects include soreness, swelling, redness, or tenderness at the injection site. Severe side effects are very rare.

Vaccines are one of the safest ways to protect your health. Even people taking prescription medications can be vaccinated. However, if you are pregnant or have a weakened immune system talk with your doctor being vaccinated, as some vaccines may not be recommended for you.

Some diseases that can be prevented by vaccines

<table>
<thead>
<tr>
<th>Disease and the vaccine that helps prevent</th>
<th>How it can affect you</th>
</tr>
</thead>
<tbody>
<tr>
<td>Influenza (“flu”)</td>
<td>Sudden high fever, chills, cough, headache, muscle aches, sore throat, muscle and joint pain.</td>
</tr>
<tr>
<td>Hepatitis A</td>
<td>Fever, fatigue, stomach pain, loss of appetite, nausea, vomiting, jaundice (yellowing of skin and eyes), dark urine, abdominal pain, muscle pain.</td>
</tr>
<tr>
<td>Hepatitis B</td>
<td>Fatigue, weakness, fever, joint pain, muscle pain, and headaches.</td>
</tr>
<tr>
<td>Human Papillomavirus (HPV)</td>
<td>Cervical cancer in women, and cancer and genital warts in both women and men.</td>
</tr>
<tr>
<td>Meningococcal Disease</td>
<td>Meningitis and meningococcal disease.</td>
</tr>
<tr>
<td>Pneumococcal Disease</td>
<td>Pneumonia, ear infections, sinus infections, meningitis, and sepsis.</td>
</tr>
<tr>
<td>Shingles</td>
<td>Painful red, raised spots on a side of the face or body, which blisters and then typically scabs over in 5-7 days and heals up within 2 weeks.</td>
</tr>
<tr>
<td>Tetanus</td>
<td>Severe muscle spasms and stiffness of all muscles, difficulty opening mouth, swallowing, or breathing.</td>
</tr>
<tr>
<td>Whooping Cough (Pertussis)</td>
<td>Cough that can last for weeks.</td>
</tr>

How to Give a Strong Recommendation to Adult Patients Who Require Vaccination

Mary C. Anderson, MD; Marie T. Brown, MD; Marie-Michele Léger, MPH, PA-C; Aparna Ramakrishnan, MA, MSW | April 16, 2015

Vaccination Care for Adults

Your recommendation is a critical factor in whether your patients receive the vaccines that they need. Research indicates that most adults believe that vaccines are important and are likely to receive them if recommended by their healthcare professionals (HCPs).

As a standard of practice, all HCPs have the responsibility to routinely assess patient immunization status and to strongly recommend vaccines that patients need. Providers who don’t stock vaccines should discuss needed vaccines with their patients, write a vaccine-specific recommendation, and then refer them to a clinic or pharmacy that provides vaccination services.

The first step in determining whether you need to discuss vaccines with your patient is assessing his or her vaccination status. Which of the following strategies has demonstrated efficacy for improving vaccine assessment?

- Standing orders
- Patient intake questionnaires
- Electronic health record prompts or reminders
- Immunization registries or information systems
- All of the above

Save and Proceed

Vaccination Status Assessment

All of the strategies discussed here can help improve vaccine assessment, though a combination may be needed to ensure that patients’ vaccine needs are routinely assessed and opportunities to vaccinate are not missed.

Standing orders or protocols for nursing staff to assess and administer needed vaccines save time and reduce missed opportunities for vaccination. Examples of standing orders for vaccines can be found at the Immunization Action Coalition (IAC) website.

Case Presentations and Videos

1. Older Adult
   - Zoster
   - PCV13

2. Adult with Diabetes
   - Hep B
   - Influenza

3. Pregnant Woman
   - Tdap
   - Influenza
