| Comments                   | Licensed in 2005  
ACIP recommends 1 dose of Tdap for children ages 7 through 10 years who are not fully vaccinated against pertussis.  
1 dose of Tdap is recommended for those ages 11 through 18 years with preferred administration at 11 through 12 years.  
Any adult 19 years of age and older who has not received Tdap should get one as soon as feasible. This dose can replace one of the 10-year Td booster doses.  
Persons who anticipate close contact with infants should receive Tdap if they haven’t previously received it, ideally at least 2 weeks before contact with the infant.  
Pregnant women should get a dose of Tdap during each pregnancy, preferably at 27 through 36 weeks gestation, irrespective of receiving Tdap in the past.  
A single dose of Tdap is recommended for health care personnel who have not previously received Tdap as an adult and who have direct patient contact.  
Tdap can be administered regardless of interval since the previous Td dose.  
Tdap can be used for the decennial Td booster. | Licensed in 2005
