**SUBJECT:** Measles Clinical Guidance  
**DATE:** 2/22/19

---

Dear EZIZ Users,

See [updated clinical guidance](#) regarding the identification and testing of suspect measles cases.

Measles continues to circulate in much of the world, including Europe, Asia and Africa. International travel, domestic travel through international airports, and contact with international visitors can pose a risk for exposure to measles. Recent measles outbreaks in other states have sparked concern about the risk to Californians. However, to date, all measles cases in the current Clark County, Washington measles outbreak were exposed locally, with little risk to Californians unless they travel to Clark County.

While providers should consider measles in patients with fever and a descending rash, measles is unlikely in the absence of confirmed measles cases in your community or a history of travel or exposure to travelers. This guidance discusses which patients should be prioritized for measles testing.
